

**Amendments to the Specification:**

Please replace the paragraph beginning at page 15, line 20, with the following rewritten paragraph:

-- The experiments show that the gains with AMA add to those obtained using multiple reference frames. The gain from AMA in the one-reference case can be measured by comparing the ~~green and pink curves~~ curve labeled with a "+" (Telenor AMA+c+1r) with the curve labeled with an "x" (Telenor 1/3 +1r), and the gain in the five-reference case can be measured between the ~~blue and red curves~~ curve labeled with a "diamond" (Telenor AMA+c+5r) with the curve labeled with a "\*" (Telenor 1/3 +5r). --
